# Experiments

How many clicks do we need to achieve a certain quality in the segmentation?

Test the algorithm for a large image dataset

# Pascal VOC2010

1928 images divided in:  
Train (964)  
Validation (964)

# Problem

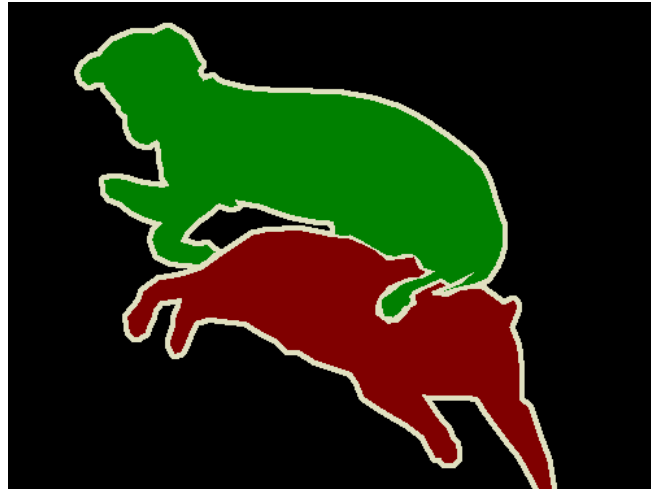

*Ask' nSeek*

Simulator

# Simulator

- The simulator generates points using the ground truth of the image.

# Simulator validation

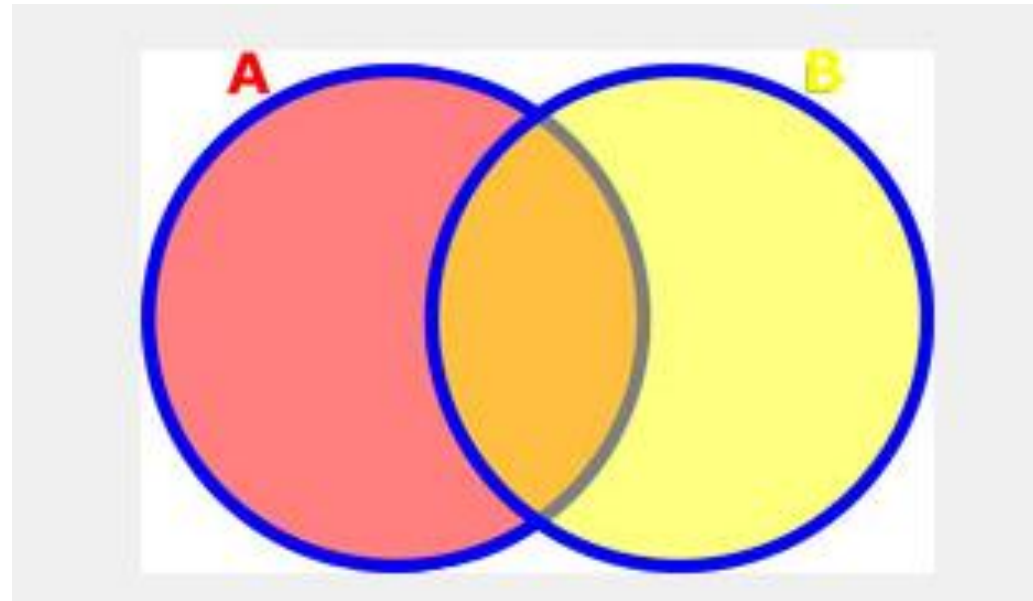

- Subset of Pascal objects with a minimum of 15 associated clicks collected with Ask'nSeek
- Comparison between real and simulated results

How do we compare?

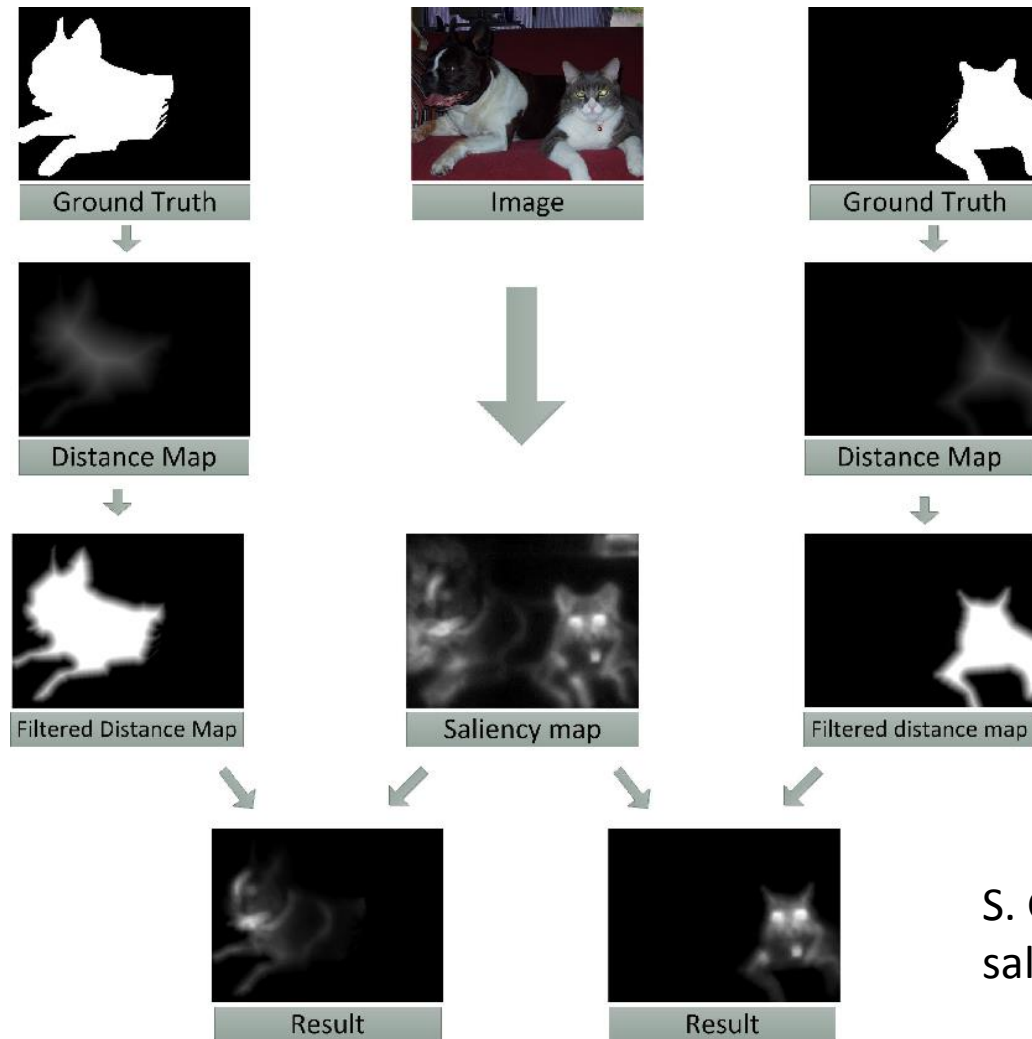

# Jaccard index

$$J(A, B) = \frac{|A \cap B|}{|A \cup B|}.$$

Similarity between the segmentation result and the ground truth mask

# Simulator: Location of clicks

	$\mu_{MSE}$	$\sigma_{MSE}^2$	$\min_{MSE}$
Saliency	0.0319	0.0007	0.0143
Random	0.0545	0.0073	0.0117

Pascal VOC2010 (train)

S. Goferman, L. Zelnik-Manor, and A. Tal. Context-aware saliency detection. PAMI, 2012.

# Simulator: FG/BG ratio

- Three configurations were tested:
  - Fixed
  - By area
  - By saliency

	$\mu_{MSE}$	$\sigma^2_{MSE}$	$\min_{MSE}$
Fixed	0.0703	0.0040	0.0277
Area	0.0472	0.0005	0.0299
Saliency	0.0453	0.0008	0.0219

Pascal VOC2010 (train)

- **Next steps**

# Conclusions

- Realistic simulator to process large amounts of data.
- Estimation of the expected AVERAGE Jaccard index by clicks.
- Inter-class variance of results.

# Next steps

- Simulator:
  - Ambiguity when multiple objects from the same class in the same image.
  - Does not generate errors, while humans do.
- Image segmentation
  - Label propagation through hierarchical partitions (eg. UCM, BPT...)
  - Grabcut + Superpixels (Kevin McGuinness, DCU).
- Data collection
  - Awarded with \$250 in CrowdMM Competition (ACM MM Barcelona 2013).
